INTERNSHIP REPORT

On

"Todo App"

(A Web Development Project)

Submitted by :

Shewale Jayashri Pandurang

Internship Title:

Web Development Internship

Organization:

Naviotech Solutions Pvt Ltd

Duration:

(13 January 2026 – 13 March 2026)

Academic Year:

2025 – 2026

DECLARATION

I hereby solemnly declare that the project titled “Todo Application”, submitted to Naviotech Solution, is my own original work and has been completed independently. All the programming, design, analysis, and documentation presented in this report have been done by me during the internship period.

This project has been carried out under the guidance of my mentor at Naviotech Solution, who provided valuable suggestions, feedback, and support throughout the development process. I am grateful for their mentorship, but I take full responsibility for the work done and the content presented in this report.S

I further declare that all results, conclusions, and interpretations mentioned in this report are a true representation of my work and learning during the internship. I undertake that, if found otherwise, I will be solely responsible for any consequences regarding academic or professional integrity.

Submitted By:

Jayashri Shewale

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Naviotech Solution for providing me with the opportunity to undertake this internship and work on the Todo Application project. The guidance and support from my mentor and the entire team have been invaluable in enhancing my technical knowledge and practical skills.

I am especially thankful to my mentor for their constant encouragement, feedback, and advice, which helped me overcome challenges and complete the project successfully.

I would also like to thank my colleagues and peers who provided assistance, shared insights, and motivated me throughout the internship. Their support played a significant role in ensuring the successful completion of this project.

Finally, I express my heartfelt thanks to my family and friends for their encouragement and understanding during the course of this internship. Their support inspired me to work diligently and complete this project with dedication.

INTRODUCTION

In today's fast-paced digital world, efficient task management is crucial for personal and professional productivity. People often face challenges in keeping track of daily activities, deadlines, and priorities. To address these challenges, a Todo Application has become an essential tool that allows users to organize their tasks, monitor progress, and ensure timely completion of responsibilities.

From a technical perspective, this project is built using Vanilla JavaScript, HTML, and CSS for the frontend, Node.js and Express.js for backend server-side processing, and MongoDB for persistent storage of task data. The integration of RESTful APIs between frontend and backend ensures smooth communication and instant updates on task status.

The project not only demonstrates the implementation of basic CRUD (Create, Read, Update, Delete) operations but also provides practical exposure to full-stack development workflow, error handling, and real-world problem-solving. This internship allowed me to understand how to connect the frontend and backend efficiently, manage database operations, and design a user-friendly interface while maintaining clean, modular, and maintainable code.

Overall, this project has provided an opportunity to apply theoretical knowledge into practice, develop technical skills, improve problem-solving capabilities, and gain hands-on experience in full-stack web development, making it a significant milestone in my internship journey.

COMPANY OVERVIEW

Naviotech Solution is a technology-driven organization that specializes in providing innovative software solutions and IT services. The company focuses on delivering high-quality products while also emphasizing practical learning opportunities for students and interns. It offers a platform for young developers to gain hands-on experience in real-world software development projects.

The organization provides internship programs that cover various aspects of software development, including full-stack web development, database management, RESTful APIs, and frontend-backend integration. Interns are exposed to industry-standard tools, coding practices, and project workflows, which help them bridge the gap between academic knowledge and practical implementation.

During the internship, students get the opportunity to work on live projects, interact with mentors, and understand the challenges faced in professional software development. Naviotech Solution encourages creativity, problem-solving, and self-learning, making it an ideal environment for developing technical and professional skills.

INTERNSHIP OBJECTIVE

The main aim of my internship was to gain practical exposure to full-stack web development by working on a complete project from scratch. The Todo Application project helped me understand the workflow of building a real-world web application and apply the knowledge I learned during my academic studies.

The specific objectives of my internship were:

- Hands-on Full-Stack Development: To develop the frontend using Vanilla JavaScript, HTML, and CSS, and the backend using Node.js and Express.js, while managing data with MongoDB.
- Understanding CRUD Operations: To implement Create, Read, Update, and Delete functionalities and connect the frontend with the backend using RESTful APIs.
- Frontend-Backend Integration: To learn how user actions on the frontend trigger backend API calls, and how responses update the user interface dynamically.
- Problem-Solving & Debugging: To handle errors, asynchronous operations, and edge cases, thereby improving debugging skills and logical thinking.

By achieving these objectives, the internship provided me with practical skills in full-stack development, improved my understanding of real-world application workflows, and enhanced my ability to design and deploy a fully functional web application independently.

PROJECT OVERVIEW

The Todo Application is a web-based task management system developed during my internship at Naviotech Solution. The primary purpose of this project was to help users manage their daily tasks efficiently while providing hands-on experience in full-stack web development.

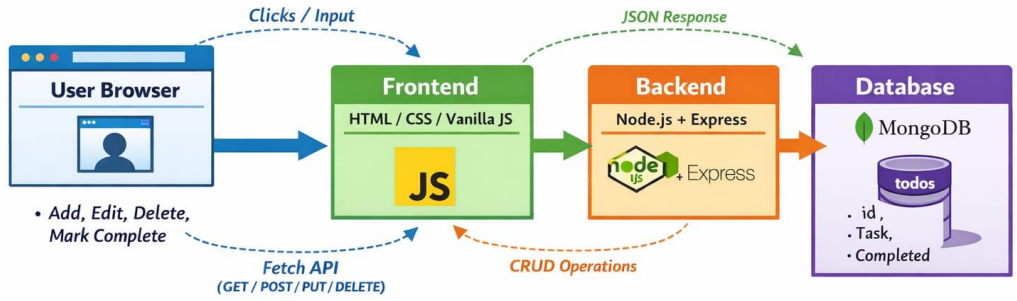
The Todo App demonstrates real-time frontend-backend integration, efficient handling of asynchronous operations, and a user-friendly interface. This project provided practical exposure to full-stack development, REST API implementation, and dynamic data handling, making it a valuable learning experience during my internship.

SYSTEM ARCHITECTURE

The system architecture of the Todo Application defines how the frontend, backend, and database interact to provide a seamless and dynamic user experience. The architecture follows a client-server model, ensuring modularity, scalability, and maintainability.

Architecture Components:

- User Browser (Client)
- Frontend (HTML, CSS, JavaScript)
- Backend (Node.js + Express.js)
- Database (MongoDB)



TECHNOLOGIES USED

The Todo Application was developed using a combination of frontend, backend, and database technologies. Each technology was selected to provide a smooth user experience, efficient backend processing, and persistent data storage.

Layer	Technology	Purpose / Usage
Frontend	HTML, CSS, Vanilla JavaScript	To create the structure, style, and interactive behavior of the web application.
Backend	Node.js, Express.js	Provides server-side functionality, creates RESTful API endpoints for CRUD operations.
Database	MongoDB	Stores tasks persistently as JSON-like documents.
Browser	Chrome, Edge	Platforms to run and test the application, ensuring compatibility and responsiveness
Tools	VS Code, Postman	VS Code is used for writing and managing

		code efficiently. Postman is used for testing API endpoints and ensuring proper backend functionality

This combination of technologies ensures that the Todo Application is scalable, maintainable, and user-friendly, while also providing practical learning in full-stack web development.

DATABASE DESIGN

The Todo Application uses MongoDB to store task data persistently. Each task is saved as a document in the todos collection with the following structure:

JSON

```
{
  "_id": "unique_task_id",
  "text": "Task description",
  "completed": false
}
```

Fields Explanation:

- _id: Unique identifier for each task.
- text: Stores the description of the task.
- completed: Boolean value indicating whether the task is completed or pending.

MongoDB was chosen because it allows easy storage of JSON-like documents, fast retrieval of tasks, and seamless integration with JavaScript-based frontend and backend.

API IMPLEMENTATION

The Todo Application backend is built using Node.js and Express.js, providing RESTful APIs for frontend interaction. These APIs handle all CRUD operations and ensure smooth communication between the client and the database.

Method	Endpoint	Description
GET	/todos	Fetch all tasks from the database.
POST	/todos	Add a new task to the database.
PUT	/todos/:id	Update a task's text or mark it as complete.
DELETE	/todos/:id	Delete a task from the database.

Explanation:

- Each task has a unique _id for identification.
- The PUT API allows updating either the task text or its completion status.
- All APIs respond with JSON, allowing the frontend to dynamically update the UI without reloading the page.

This setup ensures a clean separation of concerns, with the frontend handling user interactions and the backend managing data storage and processing efficiently.

FEATURES OF THE PROJECT

The Todo Application includes the following key features, designed to provide a smooth and interactive user experience:

1. Add Tasks: Users can create new tasks, which are saved in the database and displayed instantly.
2. Edit Tasks: Users can update the task description at any time.
3. Delete Tasks: Tasks can be removed permanently when no longer needed.
4. Mark as Complete: Tasks can be toggled between completed and pending, with visual indicators.
5. Dynamic Frontend Updates: Tasks are displayed in real-time without needing to refresh the page.
6. Persistent Storage: All tasks are stored in MongoDB, ensuring data remains even after closing the browser.

These features collectively make the application user-friendly, interactive, and practical, while demonstrating real-world full-stack development skills.

CHALLENGES FACED

During the development of the Todo Application, several challenges were encountered, which provided valuable learning opportunities:

1. Async Data Handling: Initially, tasks were not displayed correctly due to asynchronous fetch operations. This was resolved by proper use of async/await and refreshing the task list after each operation.
2. Frontend-Backend Integration: Aligning the frontend key names with the backend schema was necessary to avoid undefined values.
3. Mark as Complete Feature: Implementing real-time status toggling required careful handling of PUT requests and updating the DOM dynamically.
4. Error Handling: Managing errors from API calls and database operations was essential for a smooth user experience.

Overcoming these challenges enhanced my problem-solving skills, debugging abilities, and understanding of full-stack development workflow.

LEARNING OUTCOMES

During this internship, I gained practical experience in full-stack web development and strengthened several technical and professional skills:

1. Full-Stack Development: Learned to build a complete web application using Vanilla JavaScript, Node.js, Express.js, and MongoDB.
2. API Integration: Understood how to create and consume RESTful APIs for seamless communication between frontend and backend.
3. Database Management: Gained experience in CRUD operations and managing persistent data in MongoDB.
4. Debugging & Problem Solving: Improved ability to identify, analyze, and fix errors in both frontend and backend code.
5. UI/UX Design: Learned to design user-friendly and interactive interfaces, including dynamic updates and empty-state handling.
6. Project Management Skills: Developed skills in organizing project files, maintaining modular code, and planning development workflow.

Overall, this internship provided hands-on exposure to real-world software development, enhanced my technical knowledge, and built confidence in developing, testing, and deploying functional web applications.

FUTURE SCOPE

The Todo Application has a solid foundation and can be enhanced further to meet more advanced user needs. Some potential future improvements include:

1. User Authentication: Adding login and registration functionality to allow multiple users to manage personal tasks securely.
2. Task Categorization & Prioritization: Enabling users to categorize tasks and assign priorities for better organization.
3. Notifications & Reminders: Implementing email or push notifications for upcoming deadlines or pending tasks.
4. Mobile App Integration: Creating a mobile version of the application for better accessibility on smartphones and tablets.
5. Cloud Deployment: Deploying the application on platforms like Heroku or AWS to make it accessible globally.

These enhancements can make the Todo App more functional, user-centric, and scalable, providing a richer experience while also offering opportunities for further learning in full-stack and cloud-based development.

CONCLUSION

The Todo Application project, completed during my internship at Naviotech Solution, provided a valuable opportunity to apply theoretical knowledge into practical work. Through this project, I gained hands-on experience in full-stack web development, including frontend design, backend implementation, and database management.

The project successfully demonstrated CRUD operations, RESTful API integration, and dynamic user interaction, while also incorporating features like marking tasks as complete and handling empty states. It enhanced my problem-solving skills, debugging abilities, and understanding of project workflows.

Overall, this internship and project not only strengthened my technical knowledge and coding skills but also helped me develop a practical understanding of building real-world web applications. It has laid a strong foundation for further learning and growth in the field of software development.
